STHS: Caring for the Northshore since 1954

Not all wounds are the same. For that reason, not all wound-care patients should be treated the same.

That's why the multidisciplinary team at St. Tammany Health System's Wound Care and Hyperbaric Medicine Clinic conduct a thorough diagnostic examination of every patient and develop a care plan for that patient's needs.

That plan may include conventional and specialty wound dressings, debridement, compression therapy, total contact cast, bioengineered skin substitutes, hyperbaric oxygen therapy and more for treatment of wounds including:

- » Diabetic ulcers.
- » Pressure ulcers.
- » Non-healing surgical wounds.
- » Venous stasis ulcers.
- » Arterial ulcers.
- » Trauma wounds/ crush injuries.
- » Burns.
- » Gangrene.
- » Radiation tissue damage.
- » Osteomyelitis (bone infections).
- » Soft-tissue infections.
- » Osteoradionecrosis.
- » And more.
